Œuvre scientifique

Jean-Pierre Changeux a effectué des travaux de recherche dans plusieurs domaines de la biologie qui se fondent sur ses premières recherches sur la structure et la régulation des protéines et plus spécifiquement sur les mécanismes de transduction des signaux biologiques par interaction allostérique (1961-1968). En 1970, Changeux isole le récepteur nicotinique de l’acétylcholine à partir de l’organe électrique de gymnote : le premier récepteur membranaire de neurotransmetteur jamais isolé et cela grâce aux propriétés d’une toxine de venin de serpent. Il contribue à l’élucidation de sa

structure et à la démonstration qu'il s'agit bien d'une protéine allostérique. En 1973, avec A Danchin, il propose une théorie sur l'épigénèse des synapses en développement par sélection et la documente au niveau moléculaire. Enfin, depuis les années 80, il s'intéresse aux fonctions cognitives auxquelles il apporte à la fois des modèles théoriques et des fondements expérimentaux, principalement au niveau moléculaire chez la souris.
